Yes, the Fish shell can be installed and used on macOS, and here are the steps and some additional details to help you set it up:

Installation

To install Fish on macOS, you can use Homebrew, which is a popular package manager for macOS.

```bash
brew install fish
```

If you want to install the latest bleeding-edge version of Fish, you can use the following command:

```bash
brew install --HEAD fish
```").

Adding Fish to System Shells

After installation, you need to add Fish to the list of system shells:

```bash
echo "/usr/local/bin/fish" | sudo tee -a /etc/shells
```

Or, if you are using the new Homebrew prefix on macOS (e.g., `/opt/homebrew/bin`):
